

## Discussion of Watershed Goals

---

---

---

---

---

---

---

---

## What are your water quality goals?

- What is a healthy watershed?
- Can you name specific attributes?
- Are there ways to measure them?
- How can we measure them?

---

---

---

---

---

---

---

---

United States Code, Title 33

### Sec. 1251. Congressional declaration of goals and policy

- (a) Restoration and maintenance of chemical, physical and biological integrity of Nation's waters; national goals for achievement of objective

The objective of this chapter is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters. In order to achieve this objective it is hereby declared that, consistent with the provisions of this chapter -

- (1) it is the national goal that the discharge of pollutants into the navigable waters be eliminated by 1985;
- (2) it is the national goal that wherever attainable, an interim goal of water quality which provides for the protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water be achieved by July 1, 1983;
- (3) it is the national policy that the discharge of toxic pollutants in toxic amounts be prohibited;
- (4) it is the national policy that Federal financial assistance be provided to construct publicly owned waste treatment works;
- (5) it is the national policy that areawide waste treatment management planning processes be developed and implemented to assure adequate control of sources of pollutants in each State;
- (6) it is the national policy that a major research and demonstration effort be made to develop technology necessary to eliminate the discharge of pollutants into the navigable waters, waters of the contiguous zone, and the oceans; and
- (7) it is the national policy that programs for the control of nonpoint sources of pollution be developed and implemented in an expeditious manner so as to enable the goals of this chapter to be met through the control of both point and nonpoint sources of pollution.

## Clean Water Act

---

---

---

---

---

---

---

---

## CWA: Part I

- Focus on point source (PS) discharges to surface waters, through NPDES permitting
- Limits apply regardless of condition of receiving water, or relative contribution from the source
- Pollutant levels in discharges determined by technical/economic feasibility
- Same limits placed on all PS within each industrial grouping (50 categories/plus subcategories)
  - Generally, municipal sewage plants must achieve discharge equal to "secondary treatment"

---

---

---

---

---

---

---

---

## NPDES permitting under Sec. 402

- Illegal for point source (pipe, ditch, channel, tunnel, vessel, rolling stock, or other manmade conveyance) to discharge pollutants to surface waters without a permit
- Permit is a license granting permission to discharge
  - **Not a right: permit is revocable "for cause"** (e.g., non-compliance)

---

---

---

---

---

---

---

---

## NPDES Program: Coverage

- Industrial and municipal wastewater
- Industrial, urban, and construction-related storm water runoff
- Concentrated animal feeding operations (CAFOs)
- Active, inactive, and some abandoned mines
- Discharges from RCRA remedial action activity meeting point source definition

---

---

---

---

---

---

---

---

## Effluent (discharge) limits

- “Technology-based” end-of-pipe (concentration/mass)
  - BAT, NSPS, PSES, secondary treatment, etc.
  - Spelled out in EPA regulation packages (effluent guidelines)
  - Use best professional judgment (BPJ) if no EPA regulations
- Water quality-based (linked to TMDLs)
  - Only where tech-based controls are insufficient to meet WQS
    - Back-calculated from numeric WQC: pollutant concentrations in discharge
    - Derived from narrative criteria: whole effluent toxicity testing

---

---

---

---

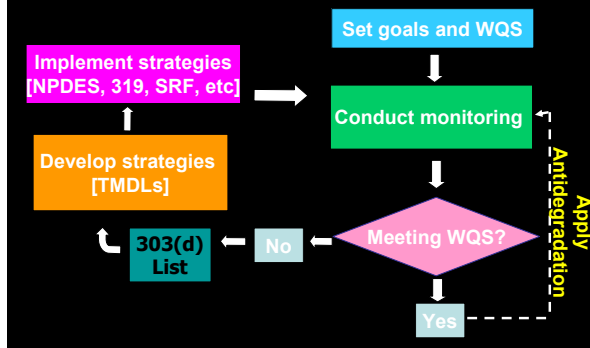

---

---

---

---

## CWA: Part II, WQ-Based

---

---

---

---

---

---

---

---

## Water Quality Standards

- State's yardstick to measure health of waters
- Three key elements of WQSs:
  - Designated uses
  - Water quality criteria
  - Antidegradation provisions

---

---

---

---

---

---

---

---

## WQS: Process

- WQS established by states and tribes
- EPA must review/approve prior to becoming effective
- If EPA disapproves a state or tribe WQS and state or tribe doesn't revise it, EPA promulgates a WQS
- Public review and comment at state, tribal, and federal levels (if EPA promulgates)
- States must review their WQS every three years and submit them to EPA

---

---

---

---

---

---

---

---

## Indian Tribes and WQS/CWA

- Section 518 of the CWA: Under specific circumstances EPA is to "treat tribes as states" with regard to CWA programs, including:
  - Water quality standards
  - Water quality monitoring and reporting
  - TMDLs
  - NPDES
  - Various CWA grant programs

---

---

---

---

---

---

---

---

---

---

---

## WQS: Key Definitions

- **Designated use** - Expression in WQS of a use of a specific waterbody that should be attained, regardless of current use
- **Existing use** - Any use that has been attained or has occurred in a waterbody since November 1975
- **Downgrading** - Changing a designated use from a "higher" (more sensitive) use to a "lower" one
- **Upgrading** - Changing the designated use from a "lower" to a "higher" one

---

---

---

---

---

---

---

## WQS: Designating Waterbodies

### *The General Rules*

- Must designate all "existing" uses
- Fishable/swimmable required, with rare exceptions
- "Waste transport" not OK
- Multiple uses OK; "most sensitive use reigns"
- Can consider economic factors
- Must not preclude attainment of downstream WQS

---

---

---

---

---

---

---

## Example Use Designation

- Aquatic life support – warmwater & coldwater aquatic habitat
- Primary contact recreation – swimming
- Secondary contact recreation – boating and fishing
- Fish consumption – eating fish
- Drinking water – domestic water supply

---

---

---

---

---

---

---

## Water Quality Criteria

- Consistent scientifically with protecting all designated uses (DUs)
- Basic types of criteria
  - Narrative/numeric
  - Water column/sediment/fish tissue
- Categories of criteria
  - Aquatic life
    - Pollutant-specific/aquatic community indices
  - Human health (drinking/fish consumption)
  - Wildlife (semiaquatic/food chain effects)

---

---

---

---

---

---

---

---

## WQS: Numeric Criteria

- **Parameter-specific: DO, temp., turbidity, N, P, Cu, dioxin, etc.**
  - Level/concentration: 1 mg/L, 5 mg/kg
  - Duration:
    - Acute: instantaneous, 1-hour, 1-day
    - Chronic: 4-day, 7-day, 30-day
  - Recurrence interval: 1 year, 3 years

---

---

---

---

---

---

---

---

## WQC: Warmwater Aquatic Life

Parameter	Value	Units
Dissolved Oxygen	>4.0	milligrams/liter
pH	6-9	Standard Units
Un-ionized Ammonia-N	0.05	mg/l
Fecal Coliform	400	Colonies/100ml
Temp	30	Degrees C

---

---

---

---

---

---

---

---

Range of US EPA Nutrient Criteria for 17 Freshwater Ecoregions	
Nutrient	Criteria
<b>Lakes and Reservoirs</b>	
Total phosphorus	0.008–0.037 mg/l
Total nitrogen	0.100–0.780 mg/l, with one Ecoregion at 1.27 mg/l
Chlorophyll a	1.90–12.35 ug/l
<b>Rivers and Streams</b>	
Total phosphorus	0.010–0.067 mg/l, with one Ecoregion at 0.128 mg/l
Total nitrogen	0.120–0.900 mg/l, with one Ecoregion at 2.18 mg/l
Chlorophyll a	1.08–3.75 ug/l
Turbidity	1.30–7.83 FTU/NTU, with one Ecoregion at 17.50

---

---

---

---

---

---

---

---

**Biological Criteria: Minimum data set for freshwater WQC derivation**

SALMONID  

SECOND FISH FAMILY  

CHORDATA  

PLANKTONIC CRUSTACEAN  

BENTHIC CRUSTACEAN  

INSECT  

ROTIFERA, ANNELIDA, MOLLUSCA  

OTHER INSECT OR MOLLUSCA  

---

---

---

---

---

---

---

---

**WQS: Narrative Criteria**

- Waters must be "free from"
  - Putrescent or otherwise objectionable bottom deposits
  - Oil, scum, and floating debris in amounts that are unsightly
  - Nuisance levels of odor, color, or other conditions
  - Undesirable or nuisance aquatic life
  - Substances in amounts toxic to humans or aquatic life

*Usually apply to all waters, regardless of use designation*

---

---

---

---

---

---

---

---

## WQS: Antidegradation

- Purpose: Prevent deterioration of existing levels of good water quality
- Two basic rules apply to all high quality waters
- More stringent rules apply to specially-designated waters

---

---

---

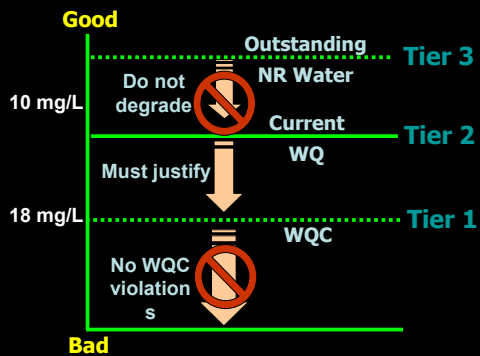

---

---

---

---

### Antidegradation Overview

---

---

---

---

---

---

---

## Total Maximum Daily Loads (TMDLs)

- Amount of a specific pollutant that a waterbody can receive, assimilate, and still meet water quality standards
- States and tribes are required to develop TMDLs for waters on their 303(d) lists
- TMDLs are approved or disapproved by EPA; if disapproved, EPA develops the TMDL

---

---

---

---

---

---

---

## TMDL Definition

$$\text{TMDL} = \sum \text{WLA}_i + \sum \text{LA}_i + \text{MOS}$$

$\sum \text{WLA}_i$ : Sum of waste load allocations (point sources)

$\sum \text{LA}_i$ : Sum of load allocations (nonpoint sources)

MOS: Margin of Safety

- Extra measure of protection due to uncertainty
- Can be explicit (e.g., 10%) or implicit (safety factors and assumptions in modeling, etc.)

## TMDL: Allocations

- Each point source with individual NPDES permit receives a wasteload allocation (WLA)
- Point sources covered under general permits can also get a wasteload allocation (WLA)
- Individual sources, categories, subcategories of nonpoint sources are represented by a load allocation (LA)

*No EPA rules on how to allocate*

## TMDL Allocation

## Prioritizing watersheds & issues

- Prioritization can be:
  - by geographic area (watershed)
  - by issue clusters (bundles)
    - sediment from logging
    - stream buffer encroachment
- Implementation guided by:
  - need (level of degradation)
  - ability (available resources)
  - desire (willing local partners)

---

---

---

---

---

---

---

---

## Tribal NPS and Watershed Issues

### Identifying Problems and Priorities

---

---

---

---

---

---

---

---

## Common NPS pollutants: bacteria

---

---

---

---

---

---

---

---

## Nutrients

Most inland fresh waters will "bloom" with algae when phosphorus is added.

Bacteria that decompose algae suck dissolved oxygen out of the water, and can lead to fish kills

---

---

---

---

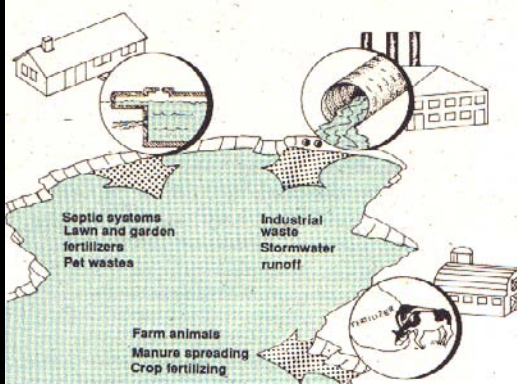

---

---

---

---

Sources of nutrients to lakes

---

---

---

---

---

---

---

---

Common NPS pollutants:  
sediment

---

---

---

---

---

---

---

---

---

---

---

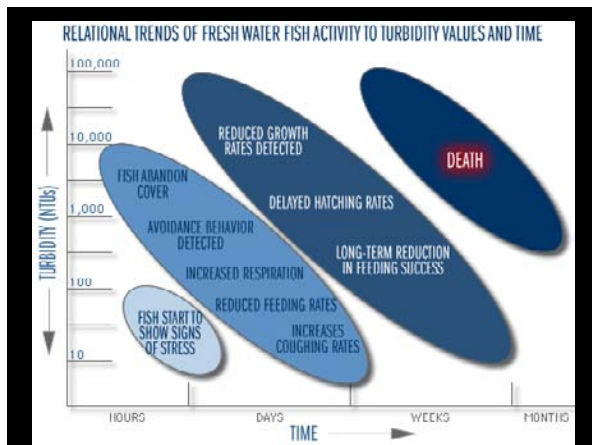

---

---

---

---

---

---

---

---

---

---

---

---

---

### Typical erosion rates (averages)

- Forest land: 1 ton/acre/year
- Farm land: 8 to 20+ tons/acre/year
- Construction sites: 100+ tons/acre/year

---

---

---

---

---

---

---

---

## Cropland impacts

- Bare soil exposed and eroding into streams
- Compacted soil increases runoff rates
- Organic matter loss further decreases infiltration
- Irrigation can deplete surface & groundwater
- Common pollutants:
  - Sediment
  - Nutrients
  - Pesticides
  - Herbicides

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Livestock production impacts

- Rapid runoff where animals are confined
- Animal waste loads are increased
- Carcass disposal can add to impacts
- Loss of vegetation along streams (pasture/range)
- Common pollutants:
  - Nutrients
  - Sediment
  - Bacteria
  - Other animal pathogens

---

---

---

---

---

---

---

---

## Agricultural impacts overall

- 59% of assessed rivers and streams in the U.S. are impaired from agricultural activities.
- The primary pollutants are nutrients, sediment, animal wastes, salts, and pesticides.
- Ag production - like urbanization - can cause severe impacts to stream channels, leading to vegetation loss, bank erosion, and massive sedimentation of receiving waters.

---

---

---

---

---

---

---

## Timber harvest impacts

- Sediment runoff from haul roads and skid trails
- Loss of forest duff & topsoil
- Soil compaction, reduced infiltration
- Loss of streamside vegetation
  - Reduced woody debris inputs
  - Reduced shading
  - Increased temperature

---

---

---

---

---

---

---

## Urban development impacts

- Pavement, roofs, sidewalks, and other hard surfaces dramatically increase runoff and decrease soil infiltration
- Runoff from urban areas contains:
  - Oil and grease (from roads & parking lots)
  - Pesticides, fertilizers, nutrients (from lawns/gardens)
  - Sediment (mostly from construction sites)
  - Heat (from hard surfaces)
  - Bacteria (from pet wastes, septic systems)
  - Trash (from roadways, parking lots,

---

---

---

---

---

---

---

## Urban pollutants & their sources

Pollutant Category	Probable Sources
Nutrients	<ul style="list-style-type: none"> <li>Atmospheric deposition and washout</li> <li>Septic system effluent through groundwater or system overflows</li> <li>Lawn fertilization</li> </ul>
Pathogens	<ul style="list-style-type: none"> <li>Urban wildlife and domestic pets</li> <li>Wastewater discharges</li> </ul>
Sediment	<ul style="list-style-type: none"> <li>Channel erosion from increased storm water runoff due to impervious surfaces</li> <li>Exposed soils at construction sites</li> <li>Urban runoff (e.g. tire wear from city streets)</li> </ul>
Industrial Chemicals and Pesticides	<ul style="list-style-type: none"> <li>Intermittent pulse exposures, often weather-related</li> <li>Runoff and groundwater contamination from land-based sources, including waste disposal sites</li> </ul>

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Streams degrade slowly, over time . . .

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

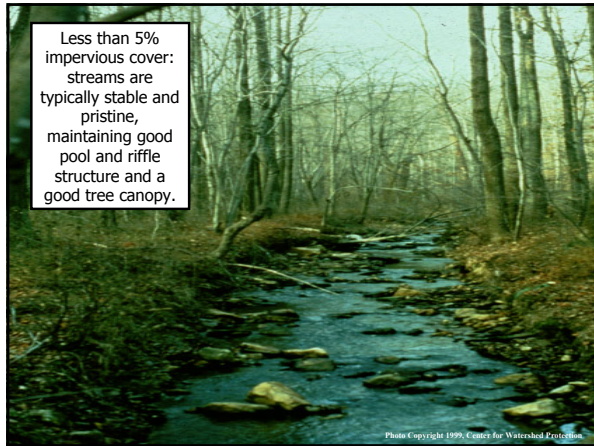

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Other impacts from the land

- **Septic systems**
  - Bacteria, nutrients
- **Old waste sites**
  - Can leach contaminants
- **Illegal dumping**
  - Used motor oil, etc.
- **Lawn & garden products**
  - Fertilizers, pesticides, herbicides

---

---

---

---

---

---

---

---

## Soils and watersheds

- Soils are a key factor governing watershed formation
  - Erosion potential
  - Runoff rates
  - Vegetation types and densities
- **Permeability**
  - Sands and gravels: High infiltration rates
  - Silt loam, sandy clay loam: Moderate infiltration rates
  - Clays: Low infiltration rate; high runoff
- Soils also affect human aspects of watershed and land use factors:
  - Agriculture
  - Development
  - Septic systems

---

---

---

---

---

---

---

---

## Why worry about soils?

- Bare soil erodes quickly, fouling waterways
  - Sediment is a "Top 3" pollutant nationwide
  - Soils can act as a "carrier" for nutrients, pesticides, herbicides
- Compacted "dead" soils have high runoff rates
  - Some ag & residential lands shed water almost as fast as pavement
- Ground water relationships
  - Influent or "losing" streams discharge to aquifers
  - Effluent or "gaining" streams are recharged by aquifers

## Healthy soils are living, breathing entities

Figure 3. Native Soil

## Impacts of soil compaction

Figure 4. Disturbed Soil Urbanization

## Soil degradation

- Erosion
- Organic matter loss
- Acidification
- Reduced biological activity
- Nutrient depletion
- Compaction
- Salinization
- Water-logging
- Chemical toxicity

---

---

---

---

---

---

---

---

## Measuring watershed health

Measurements can be taken:

- In the stream, river, lake, or wetland
- Along the bank area
- Within the uplands regions
  - Agricultural areas
  - Logging and mining sites
  - Towns and cities

---

---

---

---

---

---

---

---

## Primary factors influencing water quality

---

---

---

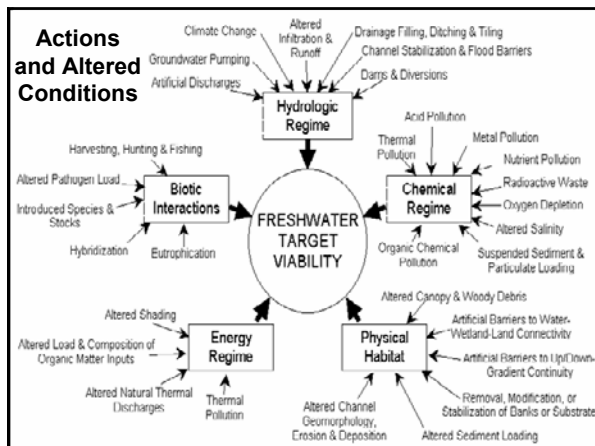

---

---

---

---

---

---

---

---

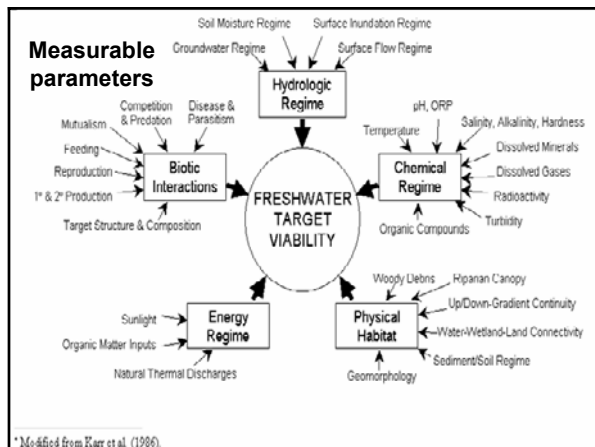

---

---

---

---

---

\* Modified from Karr et al. (1986)

---

---

---

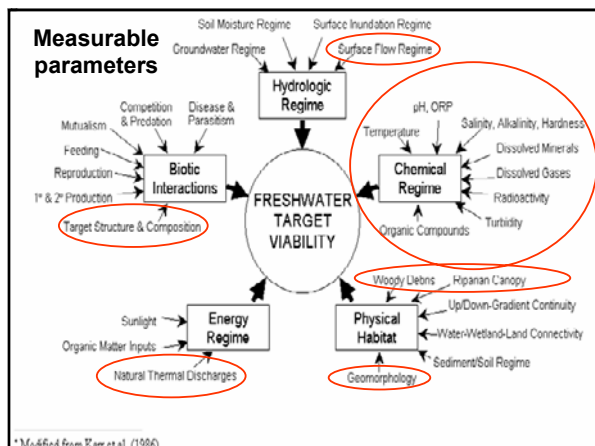

---

---

---

---

---

\* Modified from Karr et al. (1986)

---

---

---

---

---

---

---

---

Physical, chemical, and biological factors are most often measured, but flow and energy (mostly sunlight) can be important considerations

Station operated in cooperation with the Confederated Tribes of the Warm Springs Reservation.

STATION: 14095500 WARM SPRINGS RIVER NEAR SIMNASHO, OR

LOCATION: -lat: 44° 50' 00", long: 121° 10' 00", to SE 1/4 NE 1/4 sec: 7, T. 7 N., R. 11 E., Warm Springs, Oregon 97070000, Warm Springs Indian Reservation, on left bank about 0.5 mile upstream from Sanger Creek, and 4.5 mi west of Simnasho, and 40 mi SE of...

HAZARD: AREA: -107 sq. ft.

PERIOD OF RECORD: -from to September 1911, August 1949 to September 1954, October 1963 to current year.

NOTE: In October 1963, published as "No. 1000, Warm Springs, Oregon."

GAUG: -water-stage recorder: datum at page 12, 121.10 ft above datum at 1911, June to September 1911.

0.4 ft difference at different datum. August 1949 to September 1954 at same datum, at datum at Sanger site 121.10 ft, October 1963 to September 1964 at 10.4 ft upstream at datum 121.10 ft.

REMARKS: -the regulation or diversion upstream from station.

EXTREMES FOR PERIOD OF RECORD: -maximum discharge at former site, 4,670 cfs/a. Feb. 7, 1964, water height, 4.50 ft, from rating curve extended above 1,500 cfs/a on basis of slope-area measurement of post flood maximum discharge at Sanger site, 89 cfs/a Aug. 14, 1964, due to temporary diversion.

NOTE: The most current available rating for this site can be found at [www.waterdata.usgs.gov/nwis/rt](http://www.waterdata.usgs.gov/nwis/rt)

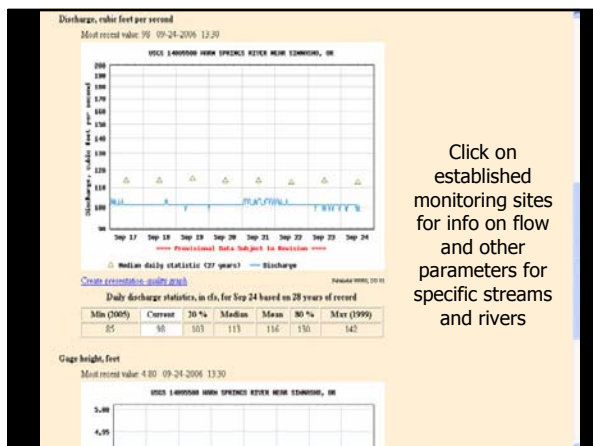

Flow data is available from the US Geological Survey web site at <http://waterdata.usgs.gov/nwis/rt>

This station managed by the Portland Field Office

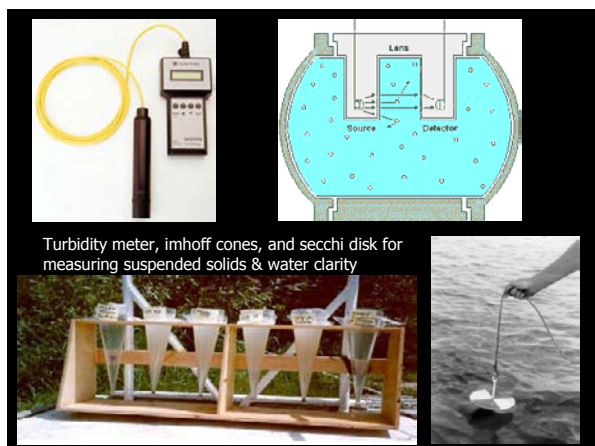

Available Parameters: ☐ All 2 available Parameters for this site ☒ 00000 Discharge ☒ 00000 gauge height

Output format: ☐ Graph ☐ Graph of state ☐ Graph of rate ☐ Table ☐ Tab-separated

Days: 1 (1-21) 22

<b>8. Bank Stability</b> (score each bank)	Bank is stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <3% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly localized over. 3-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE __ (LB)	Left Bank 10 9 8 7 6 5 4 3 2 1 0	8 7 6 5 4 3 2 1 0	5 4 3 2 1 0	2 1 0
SCORE __ (RH)	Right Bank 10 9 8 7 6 5 4 3 2 1 0	8 7 6 5 4 3 2 1 0	5 4 3 2 1 0	2 1 0

<b>9. Vegetative Protection</b> (score each bank)  Note: determine left or right side by facing downstream.	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE __ (LB)	Left Bank 10 9 8 7 6 5 4 3 2 1 0	8 7 6 5 4 3 2 1 0	5 4 3 2 1 0	2 1 0
SCORE __ (RH)	Right Bank 10 9 8 7 6 5 4 3 2 1 0	8 7 6 5 4 3 2 1 0	5 4 3 2 1 0	2 1 0

<b>10. Riparian Vegetative Zone Width</b> (score each bank riparian zone)	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadsides, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters; little or no riparian vegetation due to human activities.
SCORE __ (LB)	Left Bank 10 9 8 7 6 5 4 3 2 1 0	8 7 6 5 4 3 2 1 0	5 4 3 2 1 0	2 1 0
SCORE __ (RH)	Right Bank 10 9 8 7 6 5 4 3 2 1 0	8 7 6 5 4 3 2 1 0	5 4 3 2 1 0	2 1 0

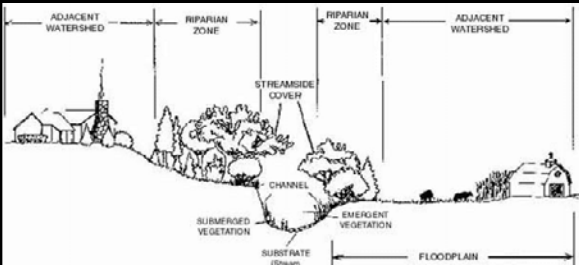

Diagram illustrating the riparian zone and watershed components. The diagram shows a cross-section of a river channel with various zones labeled: ADJACENT WATERSHED, RIPARIAN ZONE, STREAMSIDE COVER, CHANNEL, SURFACED VEGETATION, SURF RATE (Stream Surface), FLOODPLAIN, and EMERGENT VEGETATION. The riparian zone is shown as a strip of land adjacent to the channel, containing various types of vegetation and structures.

## Summary: types of data needed for holistic assessments

- Chemical
  - DO, pH, nutrients, metals, pesticides
- Physical
  - Flow, temp, turbidity, habitat, pool/riffle
- Biological
  - IBIs, macro inverts, bacteria, riparian cover
- Land uses
  - Urban, suburban, ag, forest, pervious and impervious cover, hotspots
- Potential pollutant sources
  - NPDES, mines, stormwater outfalls, site-specific

---

---

---

---

---

---

---

---

## Stream Visual Assessment Protocol (NRCS)

*One assessment tool provides basic stream health evaluation. Scores are assigned for the following:*

Channel condition	Hydrologic alteration
Riparian zone width	Bank stability
Canopy cover	Water appearance
Nutrient enrichment	Manure presence
Salinity	Fish movement barriers
Instream fish cover	Pools and riffles
Invertebrate habitat	Macro invertebrates
